

1. ReactJS is a JavaScript library used to build user interfaces by dividing the webpage into reusable components. It helps create dynamic and interactive web applications, improving the user experience compared to traditional JavaScript-based websites because React updates only the necessary parts of the page using its Virtual DOM, making the application faster and more efficient.

2. Its main feature is the Virtual DOM, which makes apps faster and more efficient.

SPA means Single Page Application – it loads one page and updates content dynamically without reloading.

3. React components are reusable building blocks of the UI. They are of two types: Functional components (use functions and hooks) and Class components (use classes and lifecycle methods).
