

1. What are components, props and useState in React? Explain different types of components with example.

Components are the **building blocks of a React app**.

They are **reusable pieces of code** that return some part of the user interface (UI).

Props are used to **pass data from one component to another** usually from parent to child.

useState is a **React Hook** that lets us add **state** (data that can change) to a functional component.

Types of components:

Functional Component: Made using a normal JavaScript function.

```
function Welcome() {  
  
  return <h1>Hello!</h1>;  
  
}
```

Class Component: Made using a JavaScript class.

```
class Welcome extends React.Component {  
  
  render() {  
  
    return <h1>Hello!</h1>;  
  
  }  
  
}
```
