

1. What is SQL?

SQL (Structured Query Language) is a standard programming language used to store, manage, and retrieve data from relational databases. It allows users to perform operations such as creating databases and tables, inserting data, updating and deleting records, and querying data using commands like SELECT, WHERE, and ORDER BY.

2. What is the difference between Data and Information?

Data: Raw facts and figures without context. Example: 85, 90, 78. Information: Processed or organized data that has meaning. Example: These are the marks scored by a student in three subjects.

3. What is Database and DBMS?

Database: An organized collection of data that can be easily accessed, managed, and updated. Example: A student database. DBMS (Database Management System): Software that helps users create, maintain, and interact with databases. It provides functions like data storage, retrieval, security, and backup.

4. What is Relational Database Management System (RDBMS)?

A Relational Database Management System (RDBMS) is a type of DBMS that stores data in tables (relations) consisting of rows and columns. It uses keys (like primary and foreign keys) to connect related data across tables. Examples include MySQL, Oracle, PostgreSQL, and SQL Server.

5. State at least 5 names of Database Management Systems or Software

1. MySQL 2. Oracle Database 3. Microsoft SQL Server 4. PostgreSQL 5. MongoDB (Optional: IBM DB2, SQLite, MariaDB)
